The webOS Ports Core Apps are designed to run on Open webOS devices, none of which have a Sym key. Plus, integrating this kind of thing on a per-app basis is unnecessary when it can be part of the framework.

I suggest contacting the Phoneygap/Cordova team about integrating this, since their toolkit the official solution for interfacing between Enyo 2 and Open webOS.

Given that this is probably being run on a webOS device, and not open webOS, I would recommend applying a patch to the Enyo framework. It is discussed on webOSNation or the Palm Developer Forums.

Looks like Jason (the Canuck one) will put it into WebOSExt for Enyo. You guys believe this to be a suitable place?

01/13/2013 03:25 PM - Josh Palmer

We switched the core apps from webOS-ext to cordova a couple of weeks ago, and have no plans to go back to webOS-ext.

I still recommend trying to get the phonegap team to integrate it, as HP won't take anything platform-specific (ex. service requests) into upstream enyo.

01/14/2013 04:42 PM - Herman van Hazendonk

OK, do we have any URL or specific contact where we can raise this?

01/14/2013 04:47 PM - Josh Palmer

I'd say either ping swisstomcat on the webos-ports IRC or go via the site: <http://phonegap.com/about/contact>
